Task 1

Description: Mobile Health Monitoring App

1. Translate the paper prototype into digital low-to-mid fidelity wireframes in Figma for the flow:
   "Login → Dashboard → Log Glucose → View Trends → Share Report" (minimum 5 screens).
2. Apply grid systems: 12-column grid for desktop and 4-column grid for mobile.
3. Ensure consistent spacing using an 8px grid system and maintain visual hierarchy.
4. Create logical navigation flow with global navigation bar and screen transitions.

Process:

1. Digital Wireframe Translation

The refined paper prototype was translated into low-to-mid fidelity digital wireframes using Figma. The following screens were created:

1. Login Screen
2. Dashboard Screen
3. Log Glucose Screen
4. View Trends Screen
5. Share Report Screen

The wireframes were designed using grayscale elements to maintain low-fidelity standards while clearly representing structure and layout.

2. Grid System Implementation

Two responsive grid systems were applied:

- Mobile Version: 4-column grid with 16px margins and 16px gutters.
- Desktop Version: 12-column grid with 80px margins and 24px gutters.

The 8px spacing system was consistently applied to maintain alignment and proportional spacing between components.

3. Layout and Visual Hierarchy

The layout emphasizes clarity and task flow:

- Primary actions (e.g., "Log New Reading", "Save", "Confirm Share") are visually emphasized.
- Information cards (e.g., Latest Glucose, Weekly Average) are grouped for readability.
- Forms are centered on desktop screens to reduce cognitive load.
- Data visualization (graph placeholder) is prominently positioned to support quick interpretation.

The desktop version restructures content using multi-column layouts, such as:

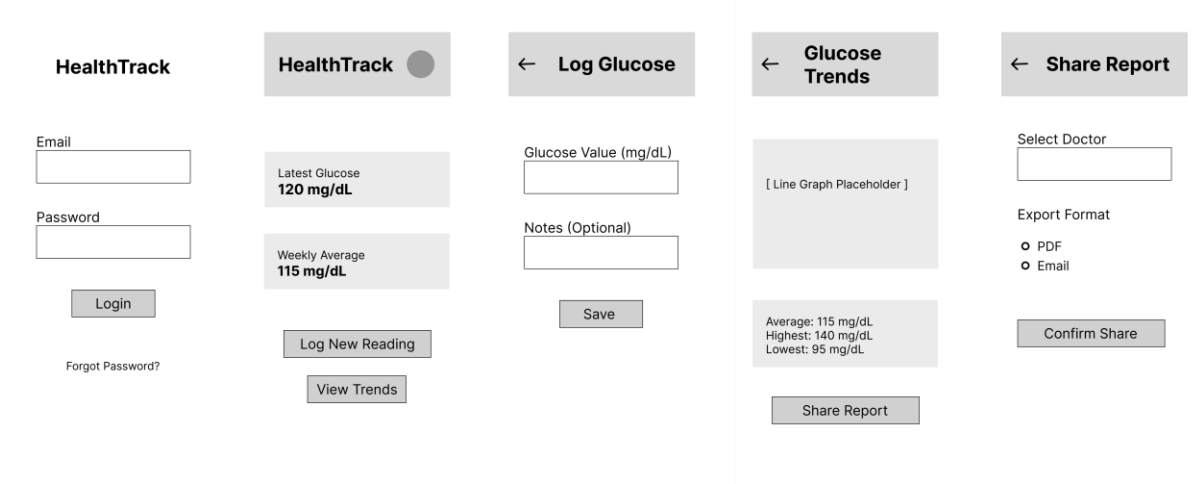
- Dashboard cards displayed side-by-side.
- Trends screen divided into graph (8 columns) and statistics (4 columns).

4. Navigation Flow

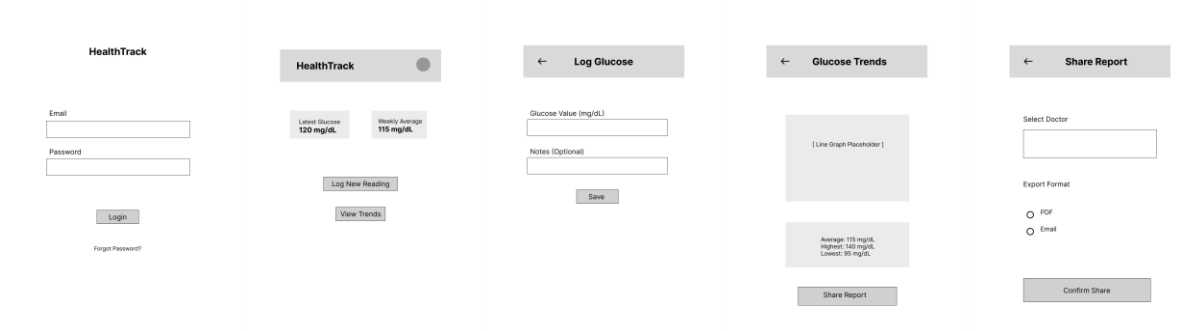
- A global navigation bar was implemented across screens to ensure consistency.
- Prototype connections in Figma simulate the following flow:
  Login → Dashboard → Log Glucose → View Trends → Share Report
- Back navigation controls were added to maintain orientation and usability.

Output:

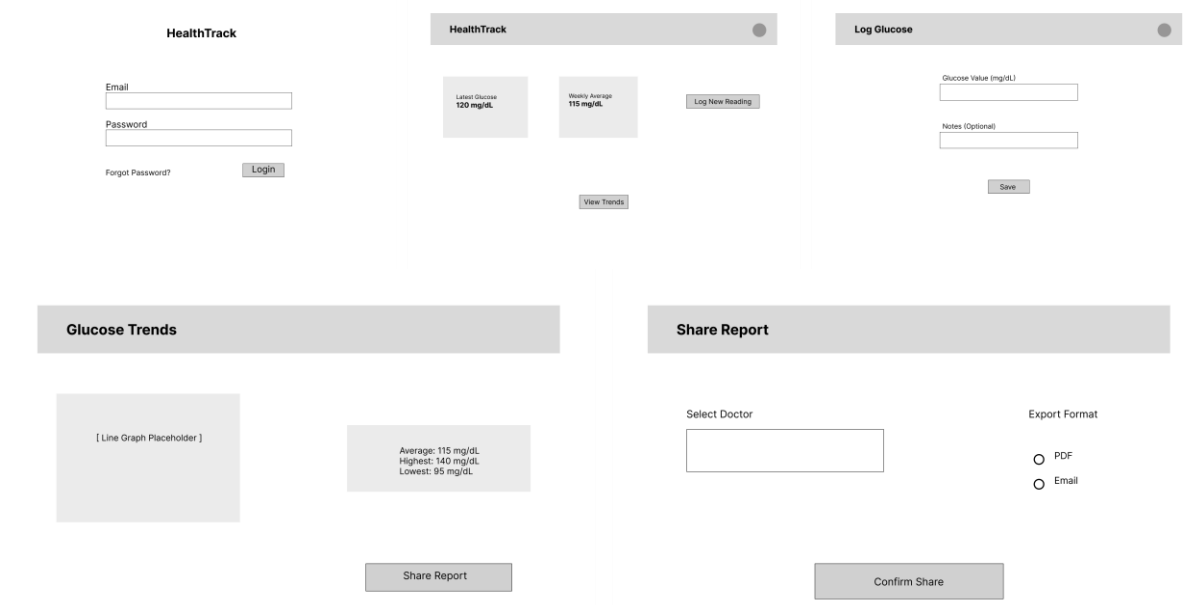
Mobile-View



Tablet-View



Desktop-View



Task 2

Description: University Course Registration System

1. Create digital wireframes in Figma for the flow:
   "Course Search → Filter Results → View Details → Add to Cart → Confirm Registration".
2. Implement responsive design for desktop, tablet, and mobile.
3. Include breadcrumb navigation, search bar, and user profile section.
4. Use reusable Figma components.
5. Add annotations explaining layout decisions and navigation logic.

Process:

1. Digital Wireframe Development

Digital low-fidelity wireframes were created for the following screens:

1. Course Search
2. Filter Results
3. Course Details
4. Add to Cart
5. Cart
6. Confirmation (Receipt)

The structure reflects progressive disclosure of information and logical task sequencing.

2. Responsive Layout Implementation

Three responsive versions were developed:

- Mobile – 4-column grid with stacked layout
- Tablet – 8-column grid with balanced content distribution
- Desktop – 12-column grid with sidebar filtering and multi-column results

On desktop:

- Filters are displayed as a sidebar (4 columns).
- Course results are arranged in a 3-column grid (8 columns).
- Course details screen uses an 8–4 column split layout.

On mobile:

- Filters are accessed through a dedicated filter screen.
- Course cards are stacked vertically for readability.

3. Navigation Structure

The system includes:

- Global navigation bar
- Breadcrumb navigation (e.g., Home > Course Search > Details)
- Profile section in header
- Clear primary and secondary action buttons

Breadcrumbs reinforce user awareness of their location within the registration flow.

4. Component Reusability

Reusable Figma components were created for:

- Primary buttons
- Secondary buttons
- Input fields
- Course cards
- Navigation bar

This ensures design consistency and scalability across screens.

5. Annotations and Design Rationale
Although annotations were not embedded directly within the Figma screens, the following documentation explains user actions, system responses, and layout decisions for the University Course Registration System.

Screen 1 - Course Search
User Actions:
- User enters a course keyword in the search bar.
- User clicks the "Search" button or selects the "Filter" option.

System Responses:
- System displays matching course results.
- If filters are applied, results update accordingly.

Design Decisions:
- The search bar is positioned prominently at the top because searching is the primary user task.
- Breadcrumb navigation (Home > Course Search) maintains user awareness of location.
- Course cards follow a consistent structure to improve scanning and comparison.

Screen 2 - Filter Results
User Actions:
- User selects filter criteria such as credits, department, or mode.
- User clicks "Apply Filters".

System Responses:
- System refreshes the course results based on selected filters.

Design Decisions:
- On desktop, filters are placed in a sidebar to improve visibility and efficiency.
- On mobile, filters are presented on a separate screen to reduce clutter.
- Clear labels are used to minimize confusion.

Screen 3 - Course Details
User Actions:
- User reviews course information.
- User clicks "Add to Cart".

System Responses:
- System adds the course to the cart.
- A confirmation screen is displayed.

Design Decisions:
- Course information is grouped logically to support readability.
- The primary action button is emphasized to guide the user.
- Breadcrumb (Home > Course Search > Details) reinforces hierarchical navigation.

Screen 4 - Add to Cart Confirmation
User Actions:
- User chooses to proceed to cart or continue browsing.

System Responses:
- System navigates according to the selected option.

Design Decisions:
- Confirmation feedback reassures the user that the action was successful.
- Two clear action options support flexible navigation.

Screen 5 - Cart
User Actions:
- User reviews selected courses.
- User clicks "Confirm Registration".

System Responses:
- System processes the registration request.
- Confirmation screen is displayed.

Design Decisions:
- Courses are clearly listed to allow review before final submission.
- Total credit information supports informed decision-making.
- The primary action button is positioned at the bottom following natural reading flow.

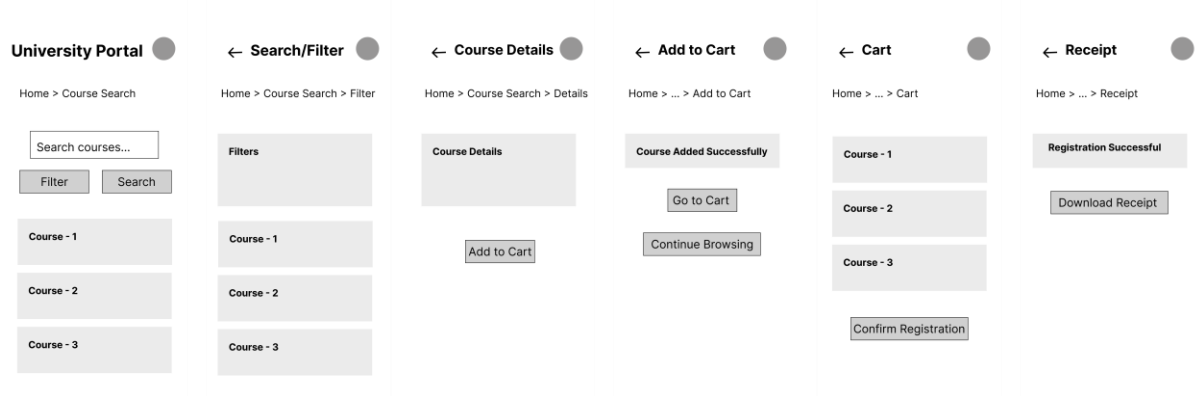
Screen 6 - Confirmation
User Actions:
- User downloads the registration receipt.

System Responses:
- System displays a success message and provides receipt download option.

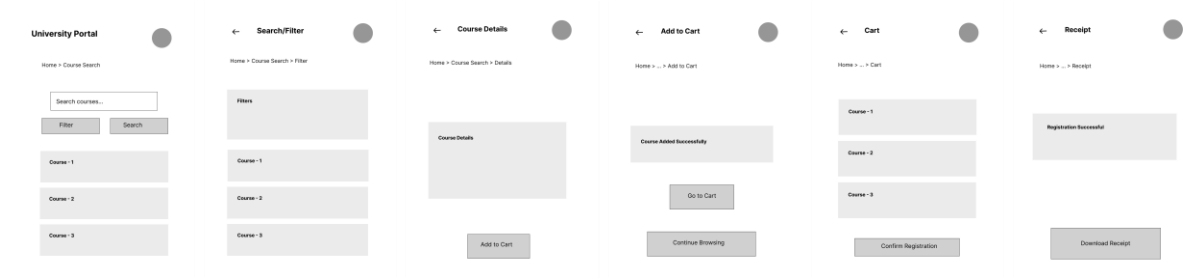
Design Decisions:
- Clear confirmation reduces uncertainty.
- Download option supports documentation needs.
- Breadcrumb navigation maintains structural consistency.

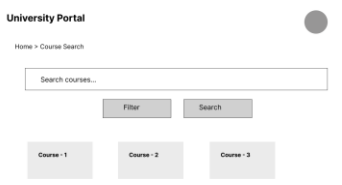
Output:

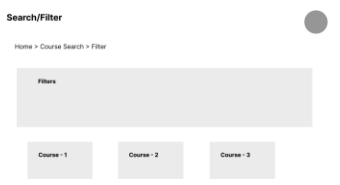
Mobile-View

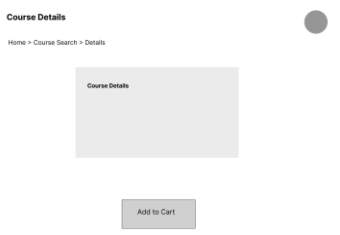


Tablet-View









Desktop-View
